How to safely handle oil and solvent-soaked material

Faulty heating or electrical equipment, defective wiring, and human error may all come to mind when thinking of things that can lead to fires. But what you may not realize is that the mishandling of rags and cloth soaked in oil, solvent, thinners, or paint can be just as dangerous. They can also cause fires, as they can easily become flammable materials. Because of this, they require special attention for safe handling.

What makes oil and solvent-soaked material so dangerous?

When a rag or cloth becomes soaked in oil or solvent oxidation can occur. This is the process of substances chemically reacting with the oxygen in the air. Heat builds up until it finally bursts into flames, also known as spontaneous combustion. In the right moisture and temperature conditions this can quickly spread fire.

Does your work regularly require the use of oil or solvent-soaked material? For example, using cloth with adhesives, rubber compounds, and aerosols to repair tires.

Here are a few key tips to remember when handling oil and solvent-soaked material to help prevent fire:
